A person should be able to create an account and log into it.

The UI should be suitable for a fitness/workout app.

Live Telemetry & Monitoring (Parallel View)

- **Real-Time Mirroring:** Display the robot's current operating state (`FOLLOWING`, `SEARCHING`, `STOPPED`) and live performance metrics (e.g., current rep count, active plank hold time).
- **Encouragement Feed:** A live log displaying the exact motivational comments currently popping up on the robot's physical screen.
- Data caught from the wristband (heartrate, and step count) should be displayed as well. (data **must be** updated after 24 hours)

Remote Control & Interactivity

- **Mode Switcher:** Allow a user from the web app to change the robot's mode remotely (e.g., click a button to force-switch the Pi from *Person Following* *Squat Counter, terminate each exercise*).
- **Emergency Override:** A prominent, global **"Force Stop"** button that immediately drops the robot into a safe state and overrides all automated ESP32 movement commands.

Historical Analytics (The Past-Week View)

- **Weekly Performance Dashboard:** Aggregated stats for the past 7 days, including:
    - Total reps completed per exercise (Curls, Push-ups, Squats).
    - Total cumulative hold time for Planks.
    - Time/date stamps for each workout session. (this means session time **without** the resting time)

- **Form Accuracy Tracker:** Visual charts (e.g., simple bar graphs) showing historical form breakdown, like the percentage of "Good Form" vs. "Flawed Form" (e.g., tracking instances of "Tuck Elbow" or "Lower Hips").

- The total gym session time for each user should be displayed as well. And its better if we can see the history of each person's past gym session times for each day. (this means total time **with** the rest time)
